

Bluetooth® LE vs 2.4GHz Proprietary wireless

Choose the right connectivity for your industrial application

April 7th 2020

Overview

- ✓ Wireless connectivity for IIoT
- ✓ Design Considerations
- ✓ Application example
- ✓ Proprietary radio overview
- ✓ Bluetooth® overview
- ✓ Bluetooth® LE vs. Proprietary radio
- ✓ Our newest products

The Industrial IoT or Industry 4.0

Remote monitoring and control

Asset tracking

Intelligent HMI

Retrofitting

Predictive maintenance

Process optimization

Enhanced safety

Virtual machines

Typical applications

- ✓ Remote monitoring and control of machines
- ✓ Indoor and co-located machines (~100 m)
- ✓ Battery operated sensors
- ✓ Low to medium data throughput necessary
- ✓ Secure communication link

Design considerations

Frequency of operation

Energy budget

Protocol

Regulatory compliance

Radio range

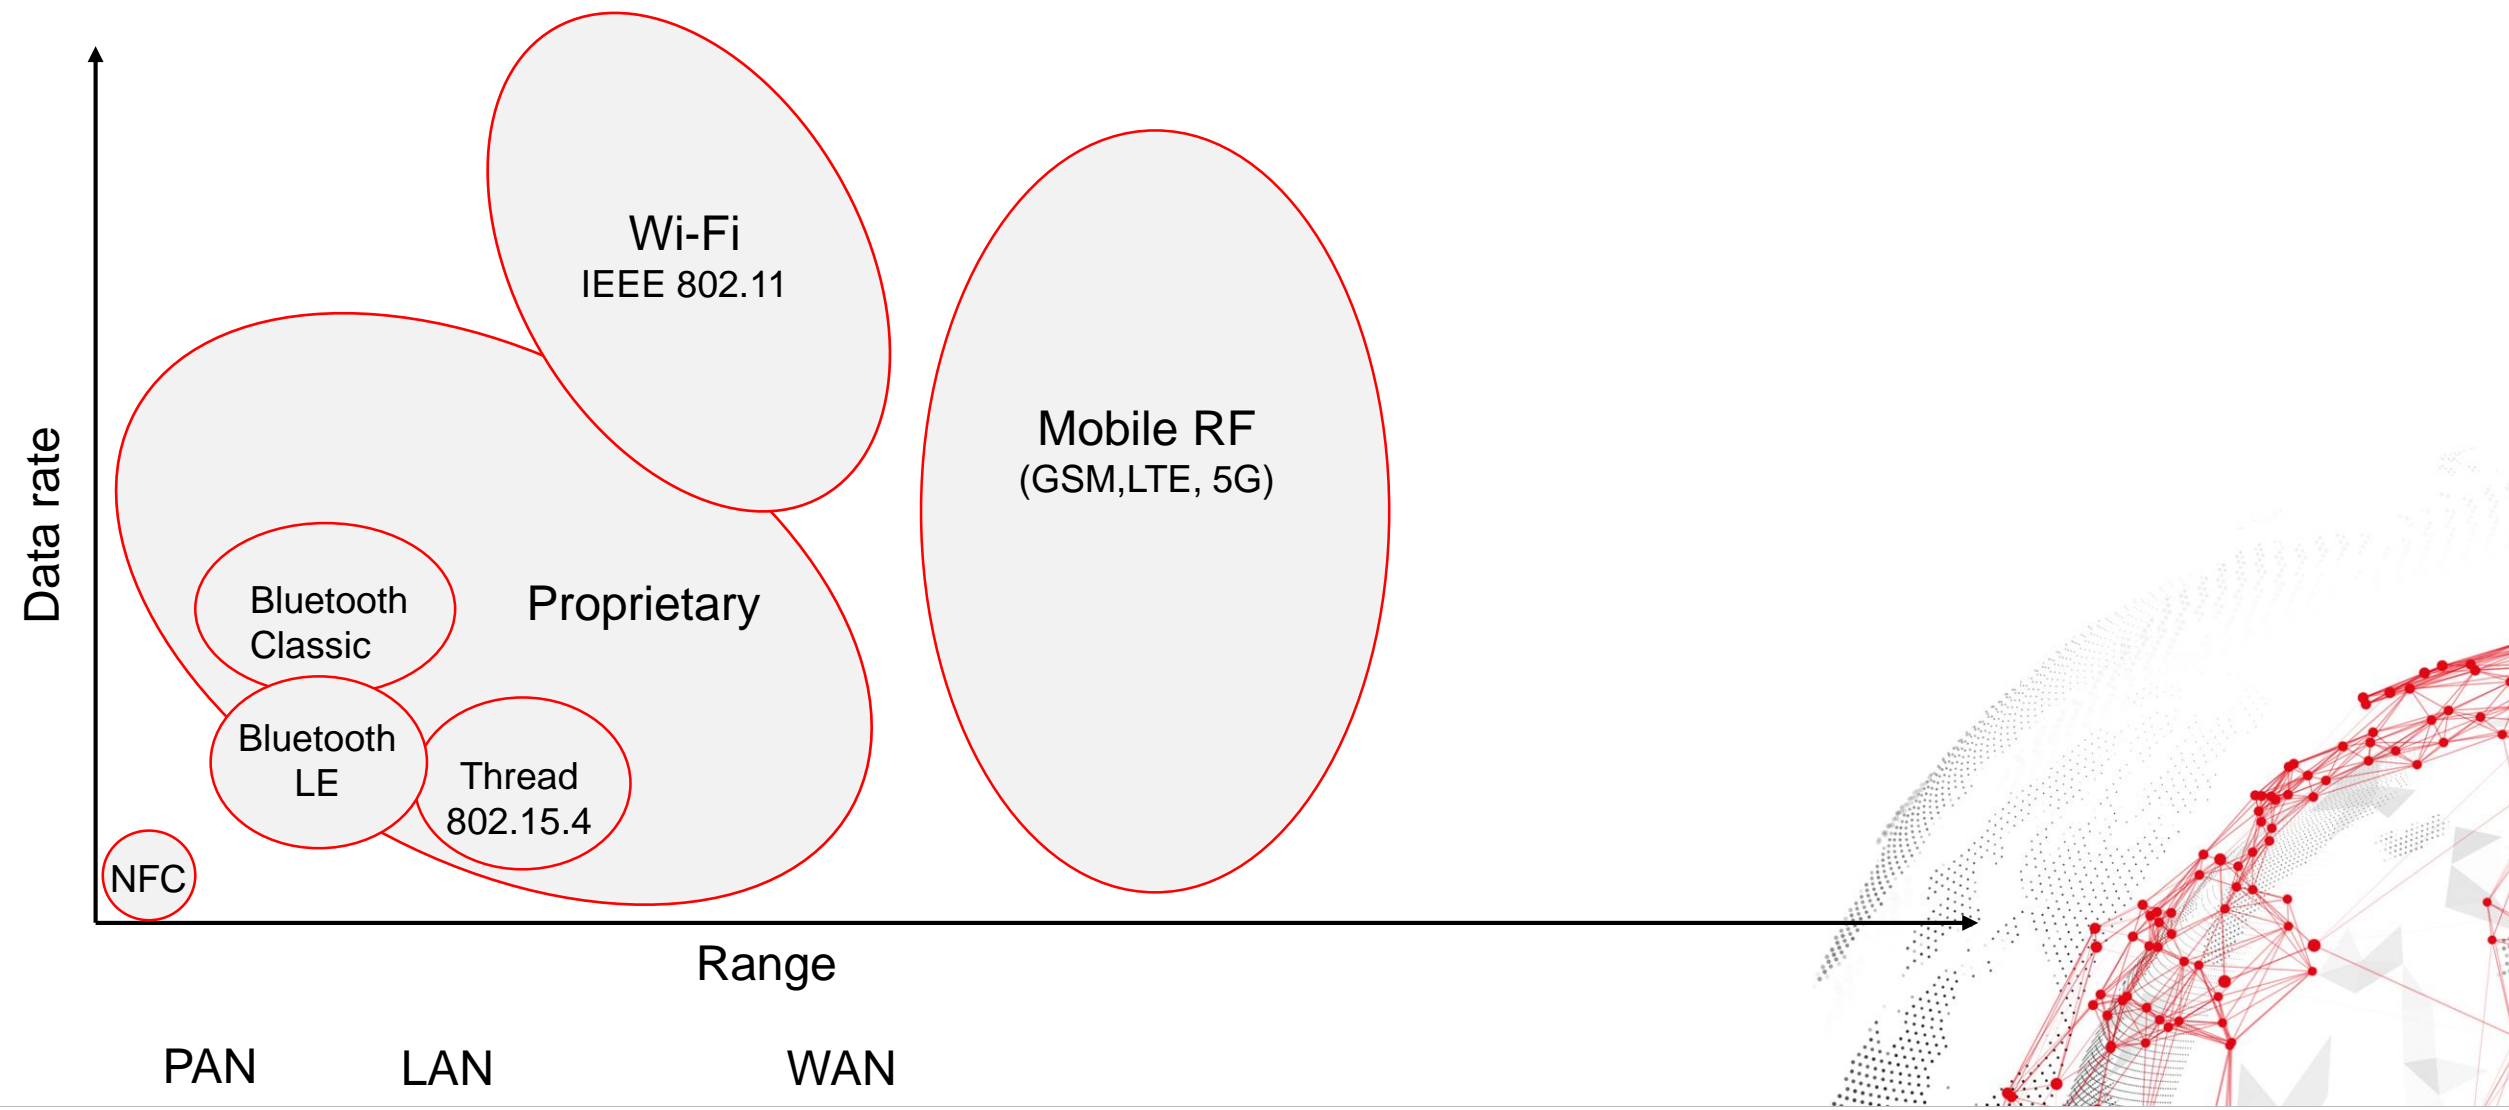

Data throughput

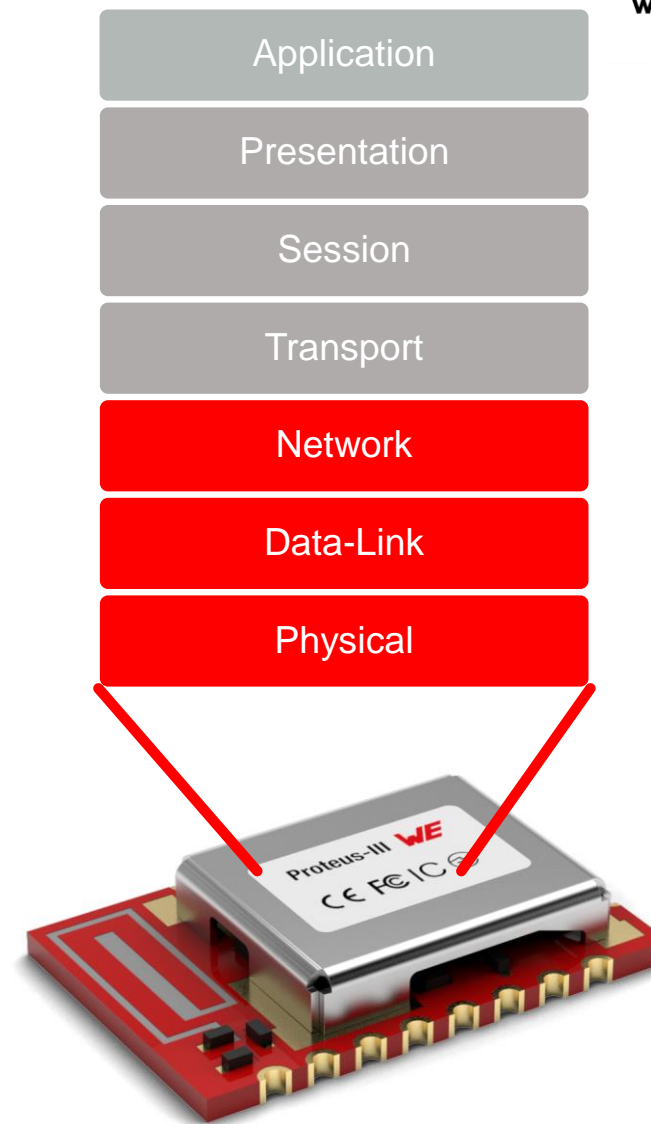

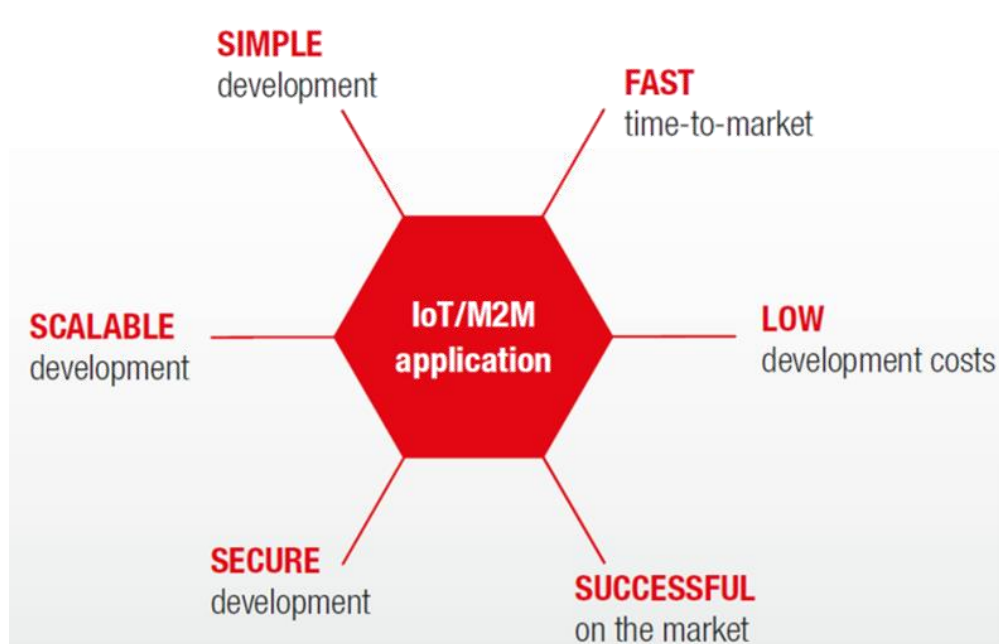

Security

Radio standards - Overview

Wireless connectivity simplified!

- Radio system on modules from **WE**
- Ready to use hardware
- Configurable firmware
- Example: The radio module 261101102xxxx of Würth Elektronik

Proprietary radio – What is it?

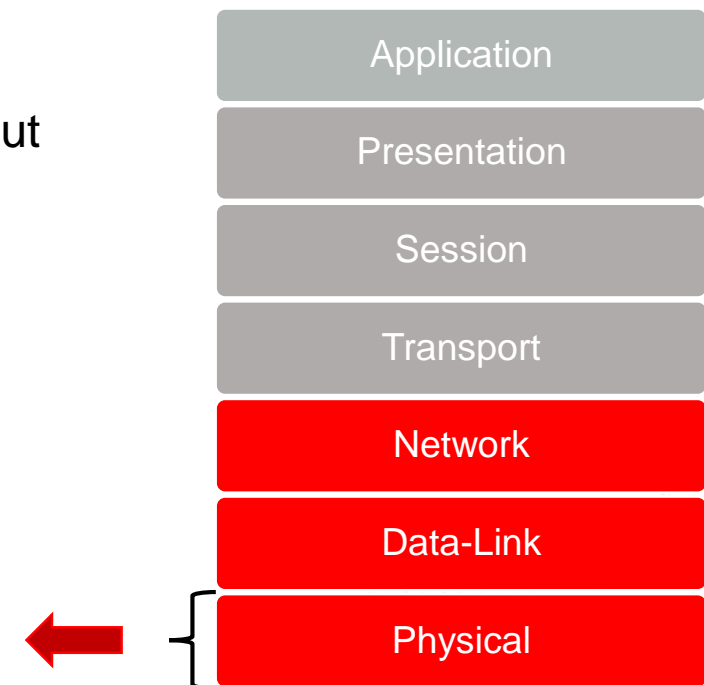

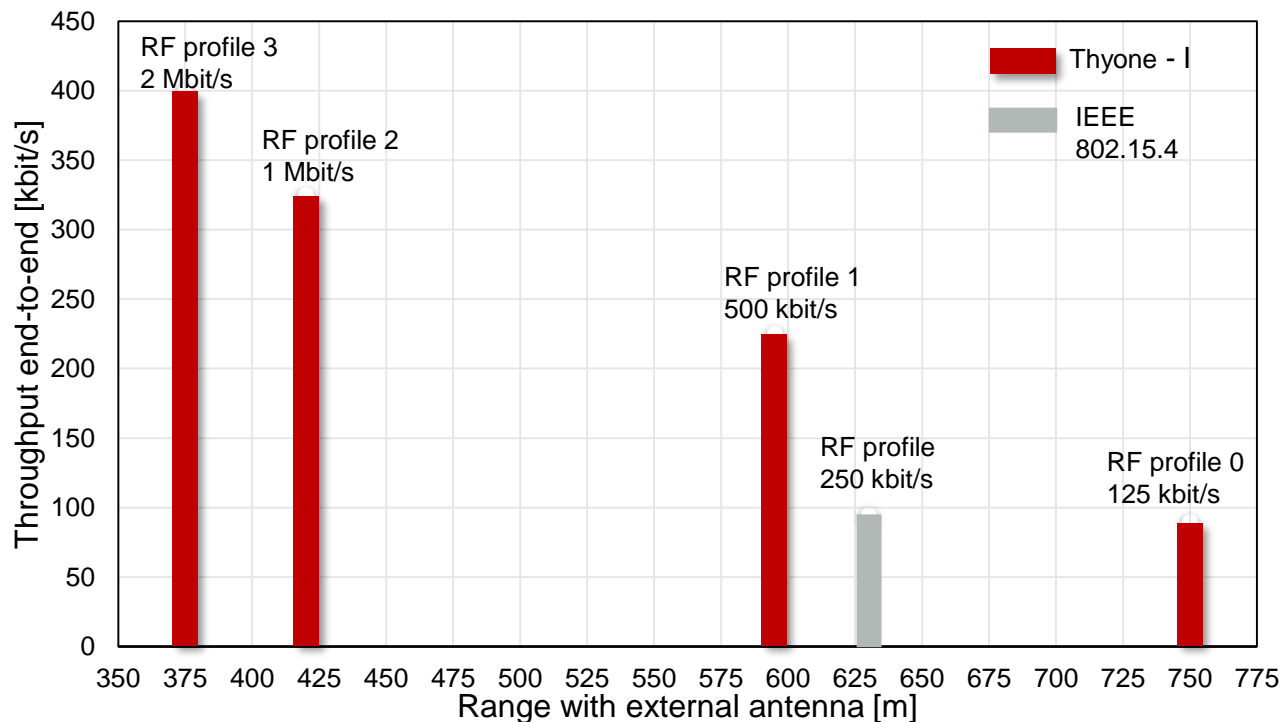

- Not conform to any standard
- Optimized for specific functionality
- Isolated operation

WE Pro-Ware – 2.4 GHz PHY

- ✓ Flexible PHY configuration – Choose between long range and high throughput
- ✓ Configurable transmit power
- ✓ Optimized for low power performance

WE Pro-Ware – Network & Data-Link

- ✓ Industry tested **proprietary** wireless stack from Würth Electronic
- ✓ CSMA-CA based Clear Channel Assessment (CCA)
- ✓ 128 bit end-to-end encryption
- ✓ ACK and retry mechanism by default
- ✓ 4 byte addressing with Unicast, multicast and broadcast capabilities
- ✓ Repeater functionality for range extension
- ✓ Flooding mesh – Minimal configuration

Collison Avoidance

Encryption

Flooding Mesh

Physical

Bluetooth® – What is it?

- Global wireless standard for simple, secure connectivity
- 2.4 GHz ISM Band – worldwide free of license
- Substitution of cables between devices (mobiles, PC, etc.)
- Connection oriented and robust data transmission
- Introduced by the Bluetooth SIG in 1998
- Bluetooth license cost (once per product type)

Bluetooth® – What is it?

- ✓ Current version is Bluetooth® 5.2
- ✓ Consists of the sub standards
 - Bluetooth® Classic
 - Developed until version 3.0 (2009)
 - Example profiles are Serial Port Profile (SPP) and audio
 - Bluetooth® LE
 - Introduced in version 4.0 (2010) and still under development
 - Designed for IoT and battery operated applications
 - Bluetooth® Mesh using non-connection-oriented Bluetooth® LE radio
- ✓ Available in all smart phones and modern computers

Bluetooth® LE

- Bluetooth® LE versions are backward compatible
- 40 channels with 2 MHz bandwidth (2.402 – 2.480 GHz)
- Radio data rate 1MBit/s (legacy), 2Mbit/s (BT 5.0) or 125kBit/s (LE coded, BT 5.0)
- Advertising on 3 channels, connection oriented data transmission on 37 channels
- Uses frequency hopping and TDMA (time division multiple access) to avoid radio packet collision and save power
- One data packet per connection interval
- Thus low energy and low throughput

Bluetooth® LE roles

Peripheral

- ✓ Offers connections and services
- ✓ Defines the security level of its services and data
- ✓ Acts as slave
- ✓ Example: Most applications, Door control, Service interface, Light, Roller Shutter, Heart rate monitor

Central

- ✓ Initiator for all connections with peripherals
- ✓ Always as master in a connection with a peripheral
- ✓ Example: mobile phone at service interface, remote controller

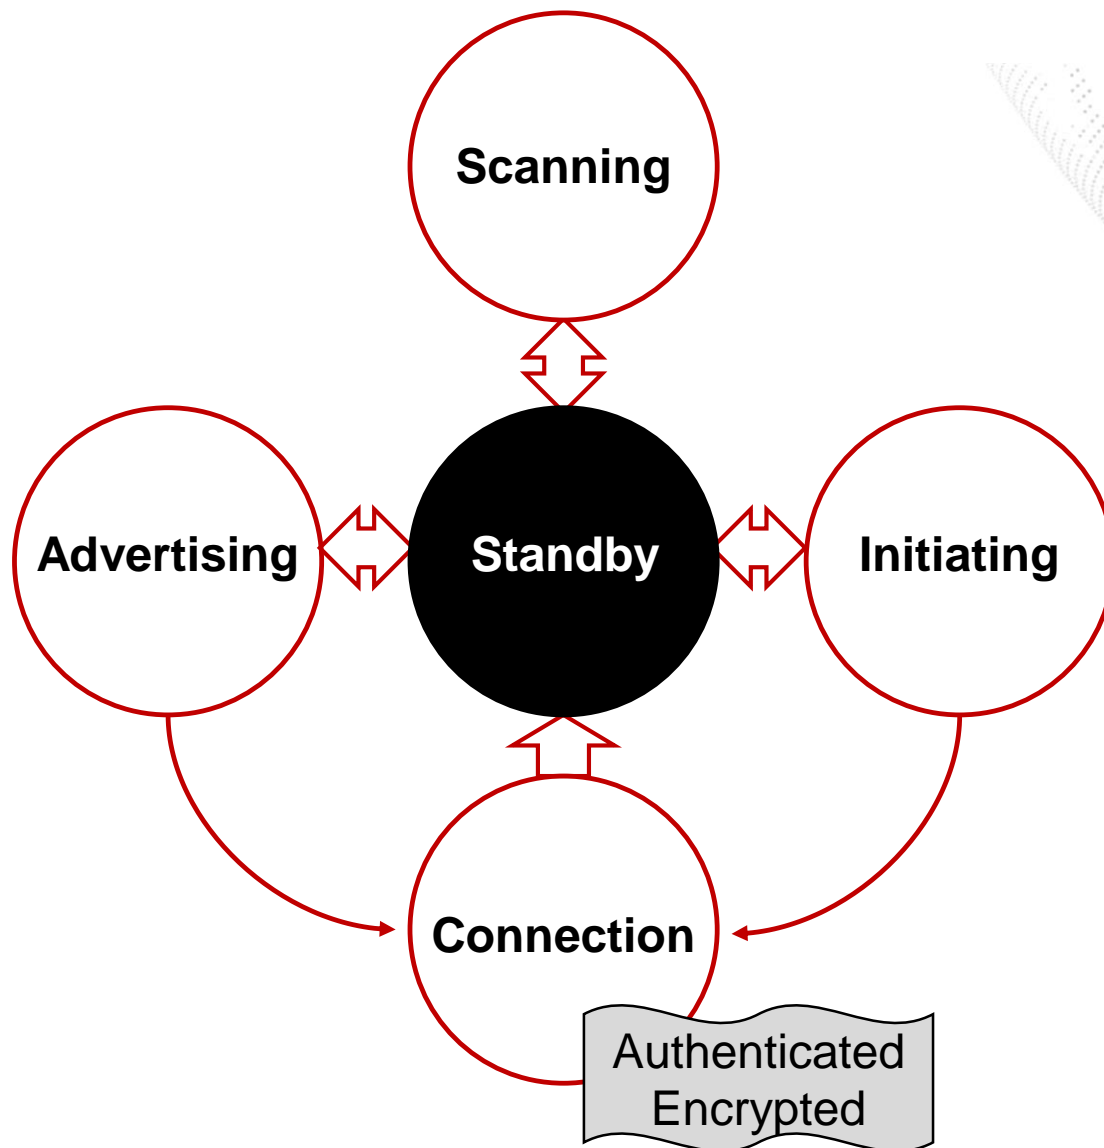

Broadcaster

Observer

Bluetooth® LE states

Too much information?

But what is the difference?

And how can I make a choice?

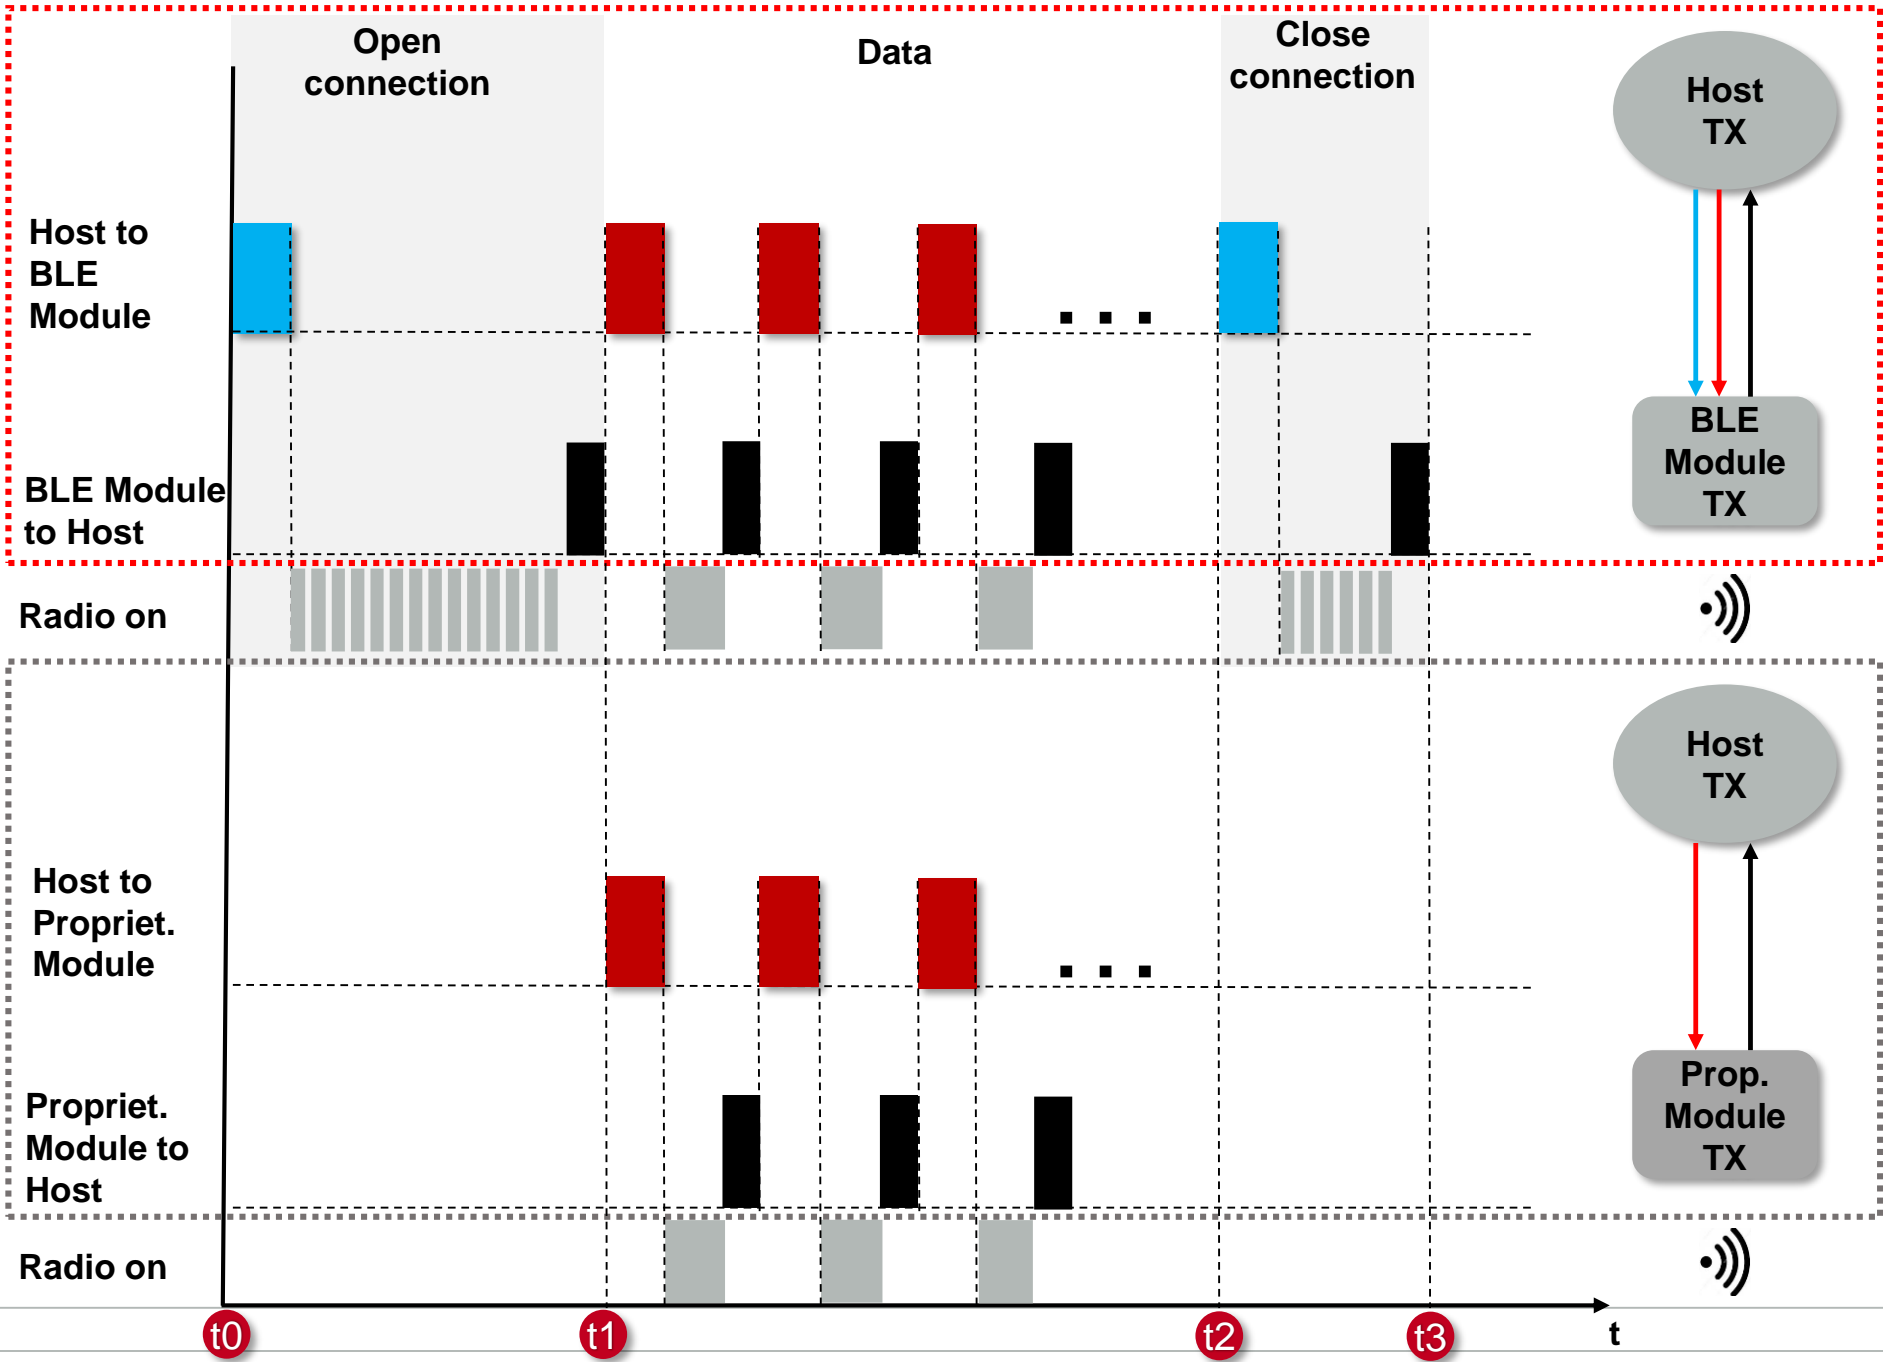

A diagram on a dark background with faint red arcs and dots. It features two red-outlined circles. The left circle contains the text 'Bluetooth® LE' and the right circle contains the text 'Proprietary Radio'.

**Bluetooth®
LE**

**Proprietary
Radio**

Bluetooth® LE vs. Proprietary radio

	Bluetooth® LE	Proprietary
Connection	Setup/Termination needs time and power	Not needed
Authentication	Supported	Not supported
Encryption	Several encryption modes supported	AES128
Throughput	Medium (restricted by standard)	Maximum (not restricted)
Power consumption <ul style="list-style-type: none"> • Transmit a byte • Wait for data state • Sleep 	<ul style="list-style-type: none"> • Medium • Low (due to TDMA) • Very low 	<ul style="list-style-type: none"> • Medium • Medium • Very low
Mesh	Not supported	Supported
Robustness	ACK, FHSS	CCA, ACK
Number of compatible devices	High, billions of Bluetooth® LE enabled devices worldwide	Low, devices of same provider
Licensing costs	Once per product type (8000\$)	None

$t_1 - t_0 \geq 20$ connection intervals
Typ. 100ms
Min. 160ms

$t_3 - t_2 \geq 2$ connection intervals
Typ. 100ms
Min. 16ms

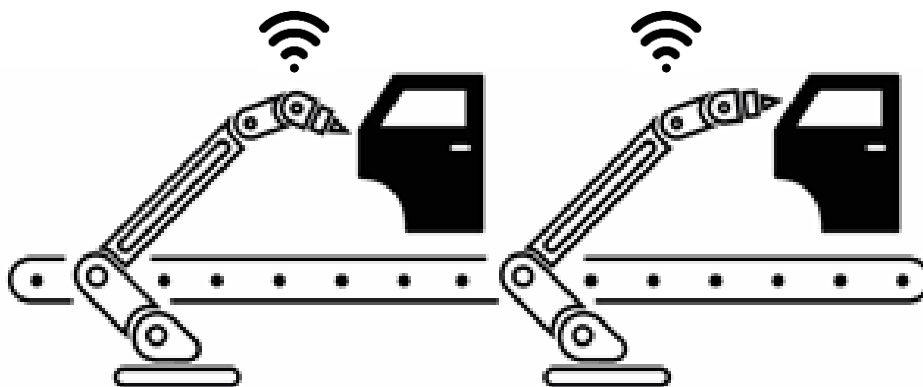

$t_1 - t_0 \approx 4-5 \text{ ms}$

$t_3 - t_2 \geq 1 \text{ connection intervals}$
Typ. 50ms
Min. 8ms

Choose the right solution for your application

- ✓ Choose proprietary radio if
 - mesh is needed to achieve higher ranges
 - the device can sleep, when not transmitting/receiving data
 - a higher throughput is needed
 - network topology needed (subnets, star, mesh)
 - a isolated network is needed
 - **Compatibility with standard devices is not necessary**

Choose the right solution for your application

- ✓ Choose Bluetooth® LE if
 - **interconnectivity to BLE enabled devices (i.e. smart phones / tablets) is needed**
 - the device is mainly waiting for incoming data and current consumption plays a role
 - advanced authentication and data encryption

Our newest products

Proteus-III

Thyone-I

Thyone-I: 2.4GHz proprietary radio

- ✓ Extremely small size of 12 x 8 x 2 mm
- ✓ Smart antenna selection (external or integrated antenna)
- ✓ Radio includes all 1 MBit/s, 2 MBit/s, 500kBit/s and 125 kBit/s long range mode
- ✓ Repeater for flooding mesh networks
- ✓ Encrypted data transmission of up to 414 kBit/s
- ✓ CCA, acknowledgements, different network topologies (point to point, flooding mesh, sub nets, broadcast)
- ✓ Sniffer included
- ✓ Remote GPIO control
- ✓ Simple command based UART or transparent UART interface
- ✓ Highly configurable and customizable via user settings
- ✓ Certification
 - CE (Europe), FCC (US), IC (Canada), ARIB (Japan)
- ✓ Development tools, evaluation boards and USB radio dongles available

Proteus-III: Bluetooth® LE 5.1

- ✓ Extremely small size of 12 x 8 x 2 mm
- ✓ Smart antenna selection (external or integrated antenna)
- ✓ Peripheral and central function included
 - Initiate AND accept connections
- ✓ Several pairing modes plus bonding
- ✓ Radio includes all 1MBit/s, 2Mbit/s and 125kBit/s long range mode
- ✓ High throughput mode (transmit 4 packets per connection interval to increase the throughput to 340kbit/s)
- ✓ Remote GPIO control
- ✓ Simple command based UART or transparent UART interface
- ✓ Highly configurable and customizable via user settings
- ✓ FOTA (firmware update over the air) via smart phone
- ✓ Certification
 - CE (Europe), FCC (US), IC (Canada), ARIB (Japan)
 - Bluetooth SIG qualified and listed
- ✓ Development tools, evaluation boards and USB radio dongles available

Radio module: Design-in

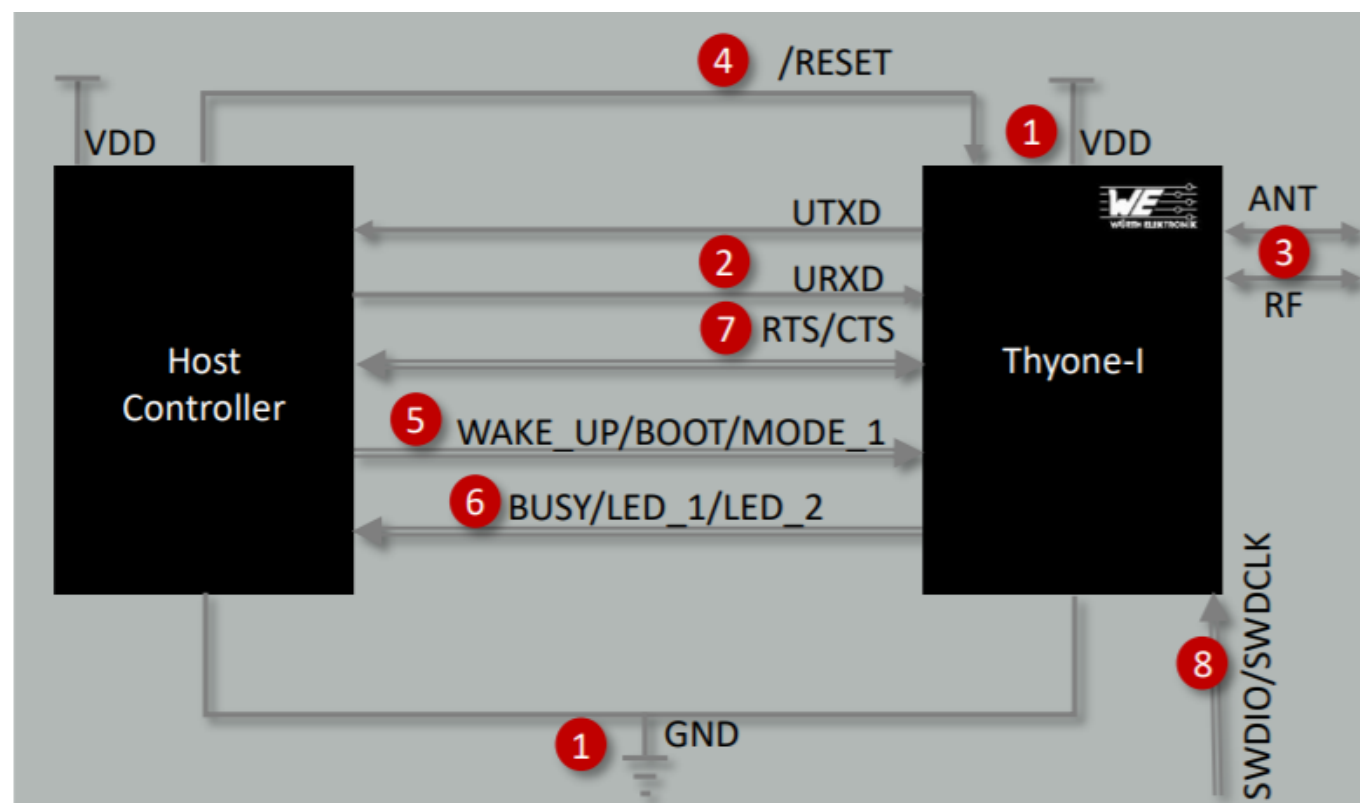

- How to connect a radio module to a host controller?

- Example Thyone-I:

Mandatory

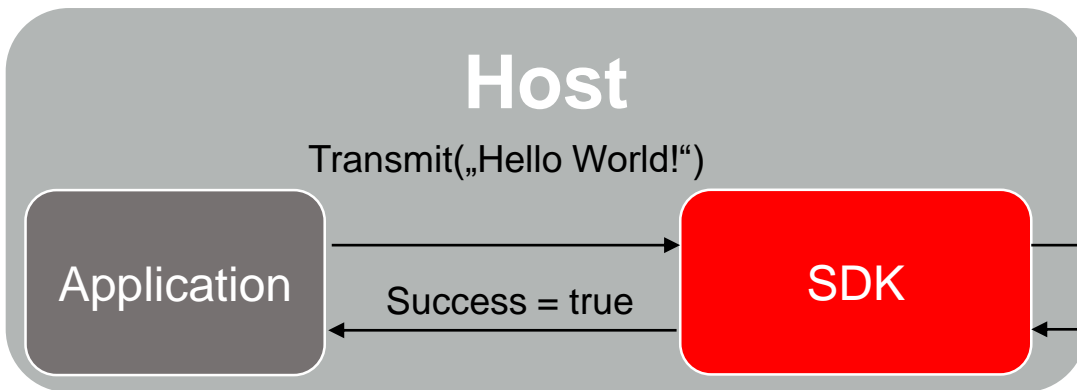

1. Power supply
2. UART
3. Antenna
4. Reset

Optional (5. – 8.)

Radio module: Design-in

Wireless Connectivity SDK in C source code for all our modules as well as USB sticks

Thank you for the attention!
